# Build a Daily Command Center With Claude Live Artifacts

INTERMEDIATE

CLAUDE

## Build a Daily Command Center With Claude Live Artifacts

[Overview](#)   [Instructions](#)   [Your Instructor](#)

## The Rundown

Learn how to build a daily command center in Claude Cowork with Live Artifacts. Instead of opening Slack, email, calendar, tasks, docs, and dashboards one by one, you will create one reusable live view for today's priorities, this week's blockers, and this month's KPIs. The goal is a scan-friendly dashboard you can understand in about 60 seconds.

Mark as complete

actually matters

Managers and team leads who need one place for blockers, meetings, follow-ups, and team updates

Creators and consultants who want a lightweight command center for content, clients, pipeline, tasks, and KPIs

## What You Will Build

You will build a Claude Live Artifact that works like a daily command center. Version one includes Today, This Week, and This Month views, plus KPI cards, quick stats, charts, and feed panels from your connected apps. Then you will layer on upgrades like priority labels, dashboard skills, refresh buttons, manual override, archive, and click-to-open updates.

A reusable Live Artifact command center

Today, This Week, and This Month dashboard views

## What You Need

Claude Desktop app

Any paid Claude plan

Connected apps or safe sample data to test with

A few KPIs or recurring work streams you want to track

## Going Further

Add dark mode, small animations, and cleaner section headers if they make the dashboard easier to scan.

Add a settings panel for update frequency, visible sources, KPI definitions, and priority rules.

Add manual override and archive controls so the dashboard stays useful when a status is wrong or an item is done.

Make updates clickable so you can open the original Slack thread, email, doc, task, or calendar event.

Use the pinned artifact as a morning ritual: refresh the dashboard, read the change report, choose the top 3 actions, and then open individual apps.

Ask Claude to summarize its understanding before it builds. A quick “Here is what I heard” step catches bad assumptions early.
