# Turn Claude Sessions Into Skills With a Daily Audit

BEGINNER

THE RUNDOWN AI

## Turn Claude Sessions Into Skills With a Daily Audit

Overview   **Instructions**   Your Instructor

### The Rundown

In this guide, you will learn how to make Claude Cowork look through dozens of session files and improve the skills you already use. It will also suggest new skills when there is enough evidence, then help you turn the audit into a repeatable skill and automation.

Mark as complete

Ran 9 commands, loaded tools >

Now I have enough evidence. Let me draft the audit.

Created a file, read a file >

Audit done. Two concrete moves, both grounded in the `working/` vs `outputs/` diff:

1. **Update** `weekly-marketing-review` — the working drafts consistently add four things the SKILL.md doesn't yet require: WoW % in headlines, action-items `Why` column + carry-over table, Slack-native formatting, and prose-paragraph leadership brief sections. Encode those as durable preferences. ~15-line edit.
2. **Delete** `skills/weekly-marketing-review.md` — duplicate quick-reference that competes with the canonical `SKILL.md`.

Everything else (source-verification as a standalone skill, a promote/archive runbook, the other installed skills) is a **skip** — no evidence in this workspace, or already covered.

Skill opportunities audit

## Who This Is For

**\*\*Heavy Claude, Claude Code, or Codex users\*\*** who keep repeating the same prompts

**\*\*Operators and creators\*\*** who want their AI workflows to improve over time

**\*\*Anyone using skills\*\*** who wants a cleaner way to decide what to create, update, or ignore

A few recent sessions or work examples for the audit

Personal skills enabled or a place where your assistant can save them

A few minutes to review changes before anything gets created

You can also run the same basic workflow in Codex if that is where your sessions and personal skills live.

## Going Further

Run the same kind of audit once on your automations.

Ask:

PROMPT

 Copy

Audit my automations.

Look for scheduled tasks that are noisy, stale, too expensive, unclear, or missing approval steps. Recommend only changes with clear evidence. It is okay to say nothing needs to change.

This helps keep your automation setup from turning into background noise. The goal is the same as the skill audit: improve the workflows that are actually being used, and leave everything else alone.
